

Here are directions for making a paper snowflake

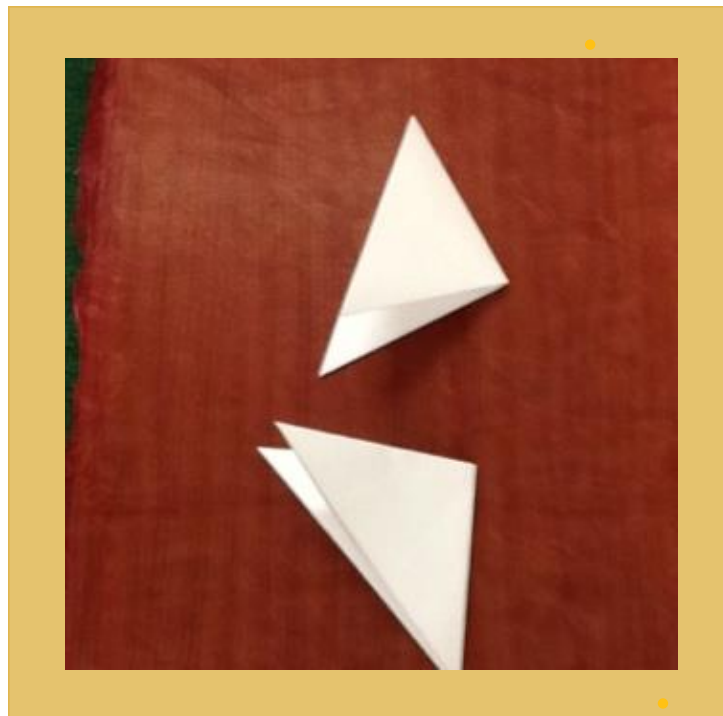

You need two sheets of computer paper and glue. Fold a corner down so that you can trim the edges to make a square.

After trimming the edges, you will have two triangles.

Fold them
a second time so the points are together.

This is a template for the center of the triangle. I made a template so that the students can run a pencil in the grooves.

Draw Arches on the centers of the triangle. These will be your cutting guidelines.

Cut out from the outer lines leaving the center corner uncut.

Cut two arches from the outer edge leaving the inner corner attached.

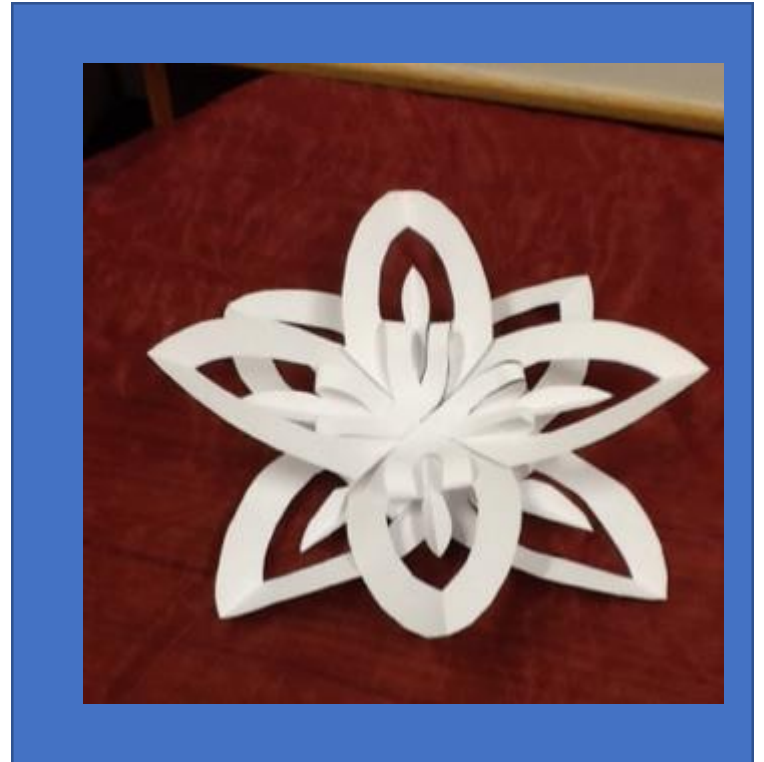

Open it up and this is how it should look. Do the same thing with the other triangle.

You should now have two parts that look the same.

Take the middle sections and glue the end tips in the center.

Now stack the two sections on top of each other and glue in the center.
